

# Building system hospital

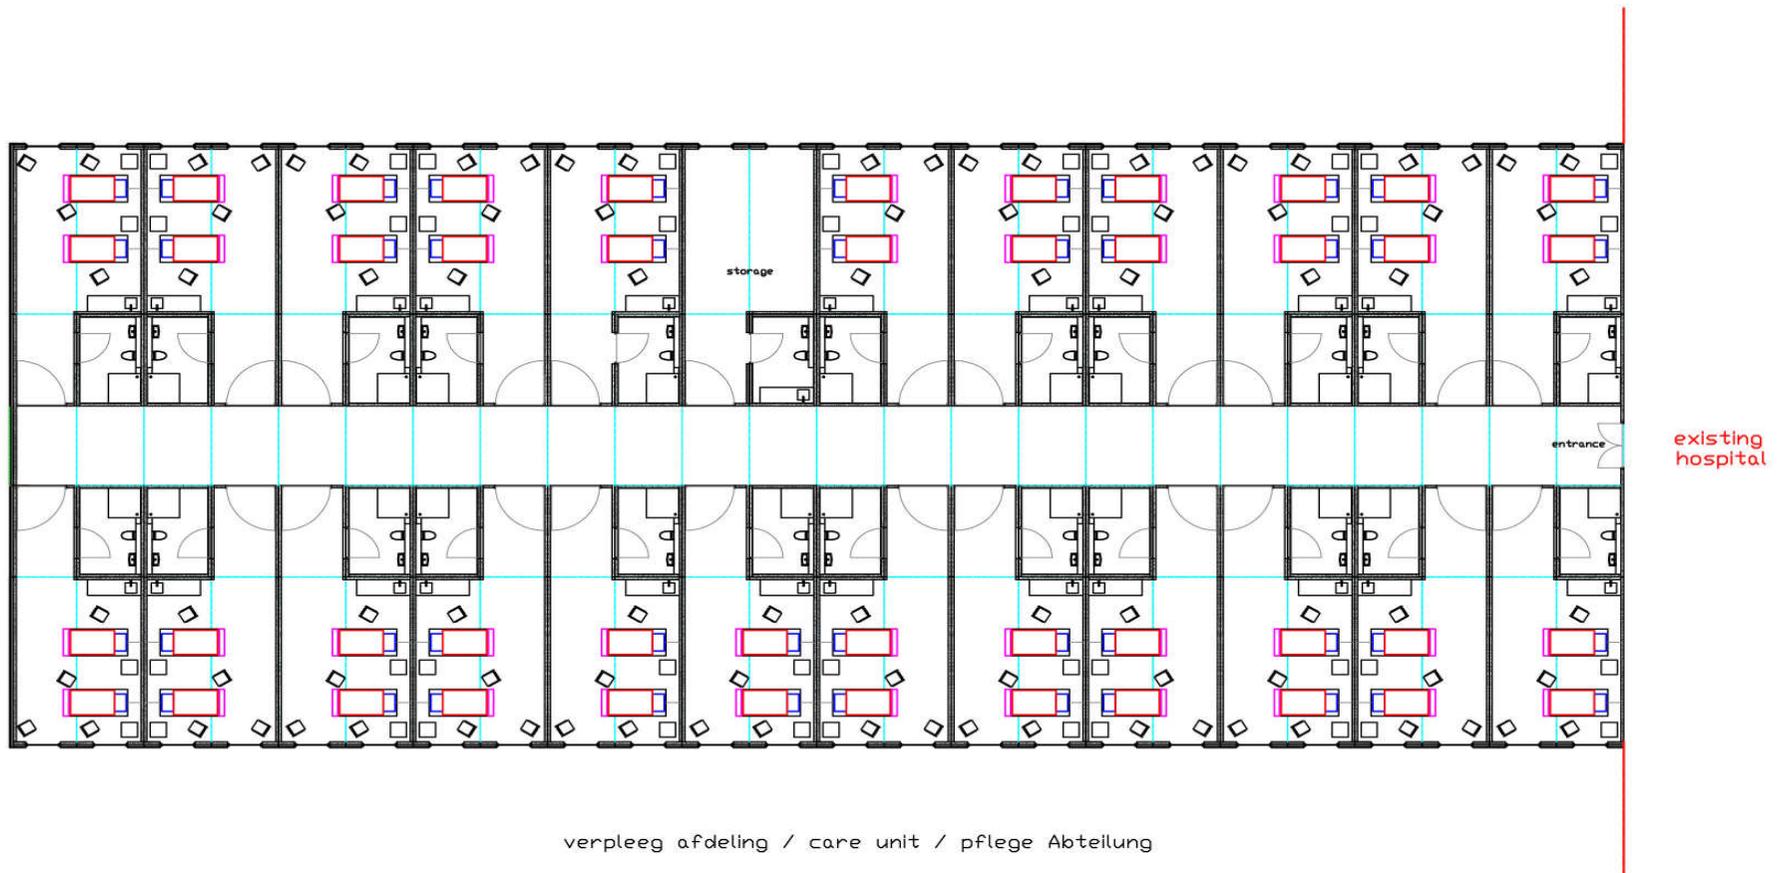

vooraanzicht front view Vorderansicht

Our building system has been designed as units which will be “ready made” produced in a factory so you get the best quality. The units are customizable for every wish and are stacked / coupled on the spot. The basic is a “put together” concrete skeleton with an isolated metal façade. The units are using floor heating/cooling. The system is a must for hospitals.

- Advantages:
1. complete dry delivery on site.
  2. short inconvenience on sit
  3. quickly usable.
  4. short extra work load (time) for the principal.
  5. extreme flexible for size, lay-out and use.
  6. short time between plan and realisation.

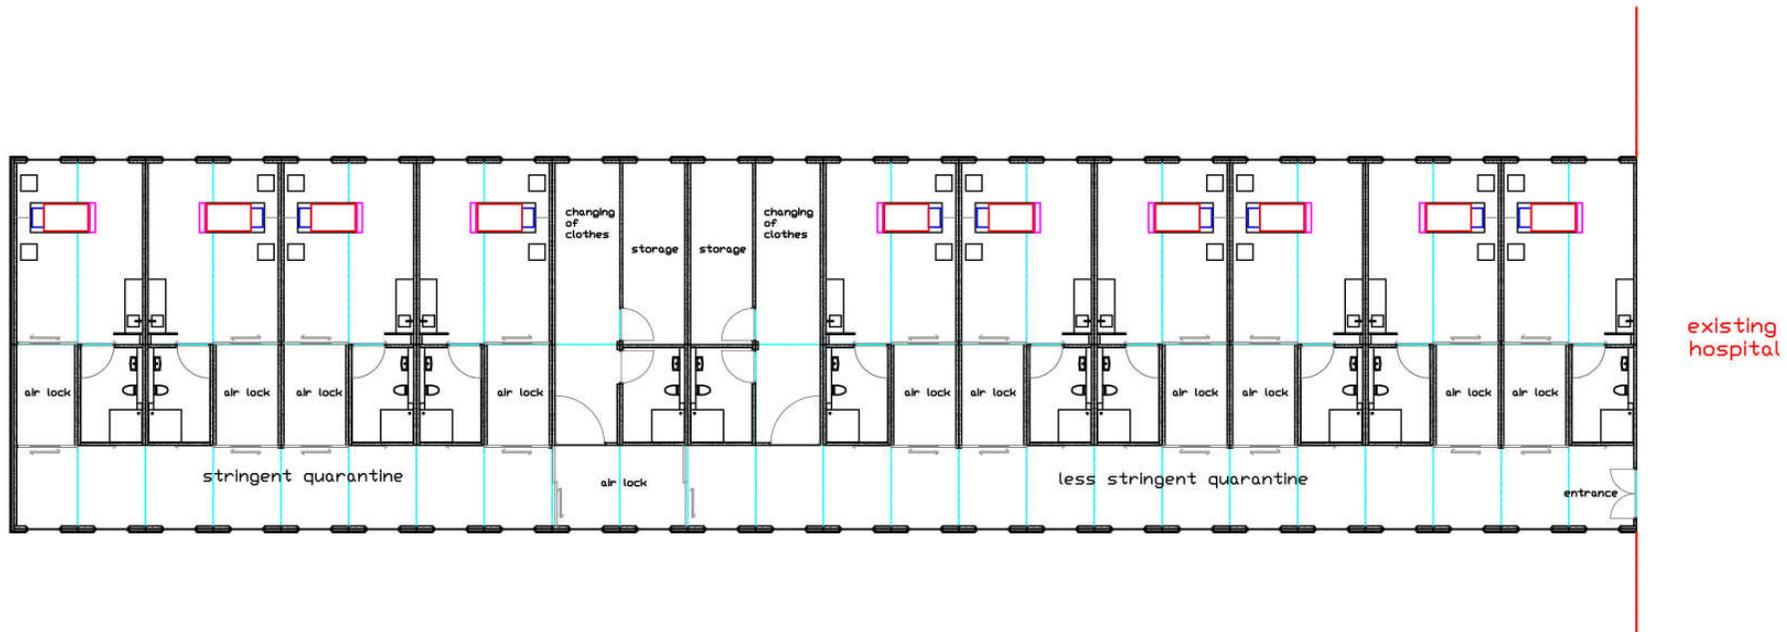

The system can be used as care-, quarantine station and care hotel as a separate wing or combined with a sleeping/living station for doctors and nursing staff (1/2/3 room units).

verpleeg afdeling / care unit / pflege Abteilung

The quarantine station can be used as single- or double lay-out.

The stations can be made shorter/longer and the lay-out between the types can be changed or be situated over different floors.

Quarantaine afdeling / quarantine station / isolier station

There are different kinds of quarantine stations possible. A stringent quarantine station which is separated from the rest of the station by an extra air lock to isolate and nurse patients who have a serious transmissible disease. A less stringent quarantine station for patients coming from a foreign hospital to be checked first for MRSA or patients who are already carrying MRSA to be isolated and nursed.
